

Case Study: Engenio's Transition to Software Product Line Practice

Greetings from BigLever,

At BigLever Software, we're committed to helping organizations very efficiently develop and maintain software product lines. Our mission is to remove adoption barriers and to enable the rapid deployment of product line technologies and methods.

One of the ways we help to remove adoption barriers is by collaborating with our customers to create case studies that *demonstrate real world software product line implementations*. We recently completed a compelling case study, featuring Engenio and their innovative transition to software product line practice by fully leveraging their *existing* software assets -- source code, architecture and processes. [The Engenio story will be presented at the 9th International Software Product Lines Conference in September.]

About Engenio's Transition

Using the BigLever solution, Engenio made an incremental, non-disruptive transition to software product line practice -- avoiding the typical upfront burden of re-engineering their development assets, infrastructure, processes and organization.

With BigLever, Engenio invested only four developer-months of effort upfront, and 12 developer-months overall, to incrementally transition 23 products, each comprising 1 million lines of code, and 135 developers to a software product line practice. *As a result, Engenio has experienced a 50% increase in development capacity and this number continues to grow.*

In addition, Engenio obtained immediate ROI from the first stage of their incremental transition, which in turn fueled their remaining transition stages.
